REASON FOR ALLOWANCE

1. Ball discloses a wheel for a pneumatic, tubeless tire, comprising a rim having a flange of height and width, and a well having a depth, a well floor diameter, a well floor circumference, and a well position relative to the flange on a mounting side of the wheel, a tire having a bead seat circumference, an additional length. Corner et al disclose a one piece wheel rim for a pneumatic tire including a pair of axially spaced tapered bead seat, a tire retaining flange located axially outward of each bead seat and a tire fitting well located between the bead seats. The flange has a reduced height portion having a length of 0.25 to 0.5 times the bead seat circumference to permit easy fitting and removal of the tire. Albert et al discloses a pneumatic tire and wheel rim assembly comprising bead seats with retaining means for retaining the associated tire bead therein. The bead seats comprises grooves which engage projections on the edge of the tire. Gaskill et al disclose a tire bead retainer comprising a locking member located adjacent the tire bead seat. The locking member is depressed by the beads during mounting of the tire. However, none of the references of record suggests a wheel for a pneumatic tubeless tire wherein the wheel satisfying a relationship having a parameter M of values in a range of approximately 75 to 100 mm and the tubeless tire is mountable on the wheel by hand without tools in the manner defined in the instant claims 1-2 and in combination with other limitations of the claims. Therefore, claims 3-4, depending therefrom, are considered to be allowable.
